High Tech Market Dynamics

- **Why go VERTICAL?** ... mainly for better total margin, there are margins at all layers of the abstraction to be gotten; more layers more margins (vertical also facilitates cross layer optimization for UX). But must be willing to invest big.
- **Why go HORIZONTAL?** ... mainly for better overall efficiency for the whole industry by sharing costs for the platform development and maintenance. But must compete with others in the horizontal space.
- **Why LAYERS OF ABSTRACTION?** ... deal with complexity efficiently and facilitate independent innovation and development in each layer; drive industry efficiency in each layer through competition at each layer.

24

11/25/2014 (J.P. Shen)

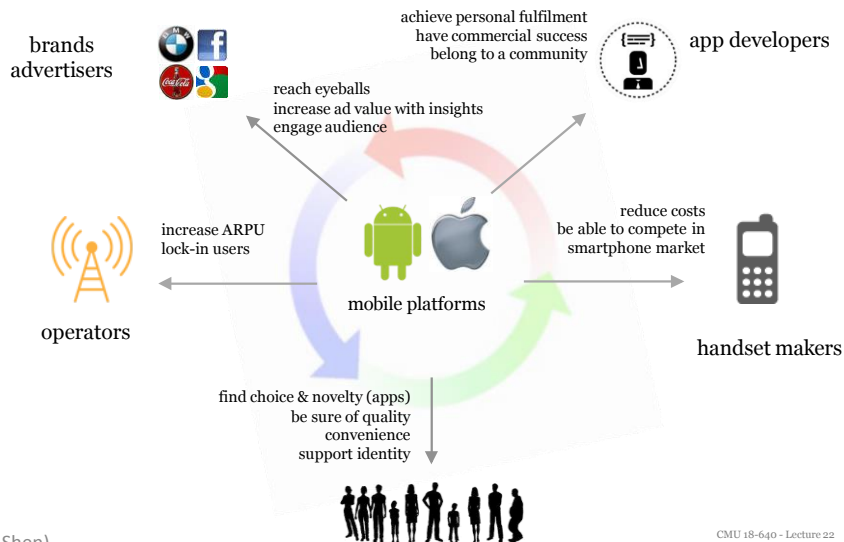

CMU 18-640 - Lecture 22

CMU 18-640 - Lecture 22

Apple, Android deliver benefits to all sides

exponential growth comes from cross-side network effects across all five sides

25

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

To compete, Challengers have to achieve the impossible

three conditions necessary to compete with Apple / Android

Three conditions to compete:

- 1 achieve the same outcomes cheaper/faster/better
- 2 activate all sides of the network simultaneously for same-rate growth
- 3 Incur additional opportunity cost for participants due to limited resources (e.g. to adopt WP you have to abandon Android)

26

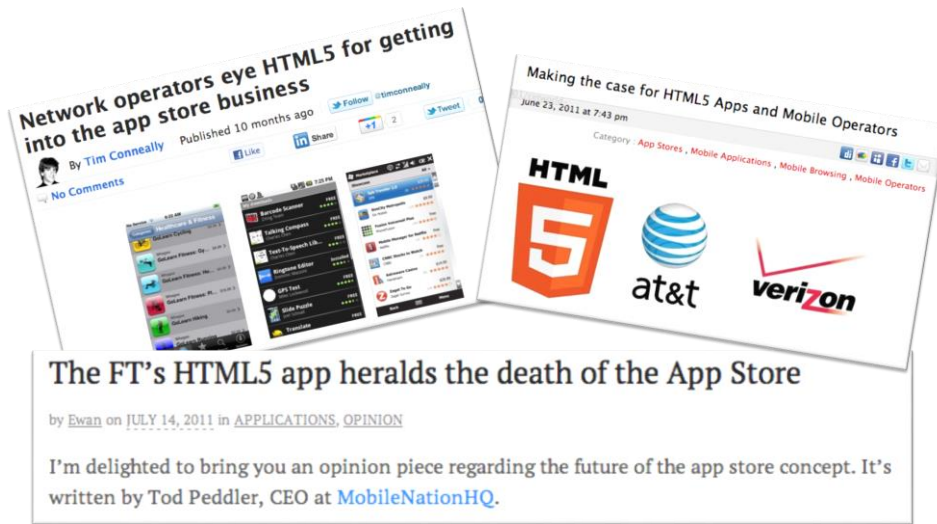

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

CMU 18-640 - Lecture 22

HTML5 is pitched as the future of mobile apps

27

11/25/2014 (J.P. Shen)

...but what is HTML5, really?

A set of browser specs by 2 standard groups: W3C and WHAT

WHAT WG - Web Hypertext Application Technologies

The WHAT working group specs merge into W3C specs

Brings capabilities of web apps closer to those of native apps

UI tools, off-line storage, 2D graphics, plugin-free video/audio
geo location, speed and communication

28

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

Copyright VisionMobile 2012

Many benefactors, but no clear leader

all pushing and hyping HTML5 for their own unrelated reasons

Apple looking to move the web away from Flash

Google searching for more ways to commoditize complements

Facebook aiming to break-down Apple/Google silos and distance Adobe

Microsoft to onboard web developers onto Windows 8

Mobile operators hoping to regain control lost to native platforms

Qualcomm aiming to create a competitive advantage for its chips

Brands looking use web as a low-cost way to go cross-device and cross-screen

Adobe aiming to sell tools that facilitate web-to-native hybrid apps

29

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

18-640 Foundations of Computer Architecture

B. “Mobile and Cloud Computing Mega-Trends and Future Directions”

(A Personal Perspective)

John Paul Shen

Nokia Fellow

November 25, 2014

Carnegie Mellon University ⁴¹

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

AD 2013: Quite A Momentous Year...

ABSTRACT:

In the summer of 2013 the total number of mobile phone subscriptions world wide surpassed the total population of our planet.

“This is totally unprecedented in the human history of technology. No technology ever, has even come close. Not television sets, not PCs, not radios, not cars, not motorcycles, not even bicycles; not credit cards, not even bank accounts; not books in print, not newspaper circulations; not the reach of electricity or landline telephones or even running water; not wristwatches, not toothbrushes, not even pens and pencils... have been as widely used as mobile is today.” [Tomi Ahonen, 2013]

By the end of 2013 the total number of smartphones world wide exceeded the total number of PCs, of any kind, in the world. These smart mobile devices are mobile computers; they also serve as rich sensing platforms on the global scale.

This talk will highlight some of the research work done by Nokia Research - North America Lab on *Mobile Sensing and Social Services* and *Visual Computing and Mixed Reality*, and suggest some interesting directions for future research in the areas of *Human Behavior Modelling and Understanding* and *Global-Scale Mobile and Swarm Computing*.

Current Mega-Trends

The computing cloud ecosystem is maturing and several trends are becoming evident and dominant

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

Carnegie Mellon University 46

Potential Disruptions

The current cloud architecture can and will be disrupted as players begin to create new and better consumer experiences

Shift Computing to the Cloud Edge:
Off Load Core Network Bandwidth Demand
Reduce Service Delivery Latency to Users

Truly Seamless Mobile Experience:
Seamless Cross-Device Cross-Domain UX
Unify both Broadband and Broadcast UX

Human Sensing for Common Good:
Deliver Real IOT Value to Mobile Users
Use both Eulerian and Lagrangian Sensing

Mobile and Cloud Computing Research Ideas (?)

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

Carnegie Mellon University 49

Computing Megatrends

➤ Leading-Edge Supercomputing

- Current TOP100 supercomputers are Petascale (10^{15} FLOPS) systems
- Challenges for next 7 years: push towards Exascale (10^{18} FLOPS) systems
- Must improve performance/power efficiency from 1 GF/W to 100 GF/W

➤ Web Based Cloud Computing

- Push towards cloud computing creates huge network bandwidth demands
- Tension will result in federated and fragmented cloud computing models
- Wireless edge of the cloud will be core to computing and communication

➤ Personal Mobile Computing

- Continuation of Moore's law expected for at least two more process nodes
- 100 GF/W technology can provide mobile supercomputers for mass market
- Dealing with legacy SW and device installed base will be a huge challenge

11/25/2014 (J.P. Shen)

CMU 18-640 - Lecture 22

Carnegie Mellon University 50

Mobile Supercomputing

➤ Mobile Supercomputers

- Improving performance/power efficiency to 100 GFLOPS/W will enable a Terascale (10^{12} FLOPS) mobile supercomputer with a 10W power budget.
- An airborne supercomputer capable of 100 TFLOPS can then be deployed in an UAV (e.g. the RQ-1 and MQ-1 Predator drone) with a 1KW power budget.

➤ Architecture Innovations

- Dataflow driven execution model supported by powerful SW tool chain and programmable and extremely energy-efficient HW fabric will be essential.
- Exploitation of massive data level parallelism and inherent data redundancy.

➤ Form Factor Innovations

- Extreme integration via 3D TSV die stacking of diverse technology dies, e.g. many-core processors, high-BW DRAMs and SSDs, FPGA, and power delivery.

Emerging Killer Applications

➤ Real-Time Environmental Sensing and Processing

- Highly mobile and autonomous real-time data collection, data analytics, and data inference, without having to off-load to some remote cloud infrastructure.
- Example: real-time traffic, special events monitoring, disaster management.

➤ Rapid Situational Deployment of Cloud Resource

- On-demand localized wireless service can be provided by an UAV equipped with an airborne base station for special needs, e.g. a major sporting event.
- Such drone based resource can provide very low latency and high bandwidth local services and function as the edge of the traditional cloud infrastructure.

➤ Swarm-of-Drones Infrastructure for Demanding Scenarios

- Swarm of collaborating drones can be rapidly deployed to provide wireless communication and Petascale (10^{15} FLOPS) supercomputing infrastructure.
